Paper Prototype 2.0

Because it was difficult to get the idea across that this would be a sound-reacting google cardboard experience, I tried a different approach for this prototype. I tried to mock up the shape of a google cardboard, and created a long strip of paper that would kind of act like series of slides. Instead of having the user flip through pages, I wrote "Speak to Begin" on the first 'frame', and as they talked to me I would pull the long strip up to show a new scene. The feedback that I got from this was that they didn't if they were supposed to keep talking after the first frame, so I should something else, maybe notes that say "Speak Louder" if the mic is barely able to pick up their speech.
